Generate a series of 24 character passwords. For each split them into 12 character groups. Then randomly recombinate them into 24 character passwords. Use these in printed or digital copies in the financial bugout bag.

However, again take each 24 character password and slit it in half. For one half reverse the character order of one of the 12 character halves, and for the other invert the letter case. Recombinate the two halves back into 24 character passwords. These are used as the actual passwords while the unmodified versions are the printed version. Do not log which half was reversed and which half was case inverted.

Further, out of a group of 10 such passwords, use only 5. The others are time wasters.
